

2+12

h1 ping h2, 但其實封包是送到h3 (單向)

運用在DB, 就近取資料, DNS查詢

```
/mininet-wifi/example# python3 miniedit.py
```

設定 CO Type: Remote Controller

```
/test # python 4.py
```

```
> xterm h1 h2 h3
```

```
h2  
# iperf -s -i 1 -u
```

```
h3  
# iperf -s -i 1 -u
```

```
h1  
# iperf -c 10.0.0.2 -u -b 1M -t 100
```

```
> sh ovs-ofctl add-flows s1 ip,nw_src=10.0.0.1,nw_dst=
10.0.0.2,actions=mod_de_dst=00:00:00:00:00:03,mod_nw_dst
=10.0.0.3,output:3
```

(双向) h3 回復 h1

```
> sh ovs-ofctl add-flows s1 ip,nw_src=10.0.0.1,nw_dst=
10.0.0.2,actions=mod_de_dst=00:00:00:00:00:03,mod_nw_dst
=10.0.0.3,output:3
```

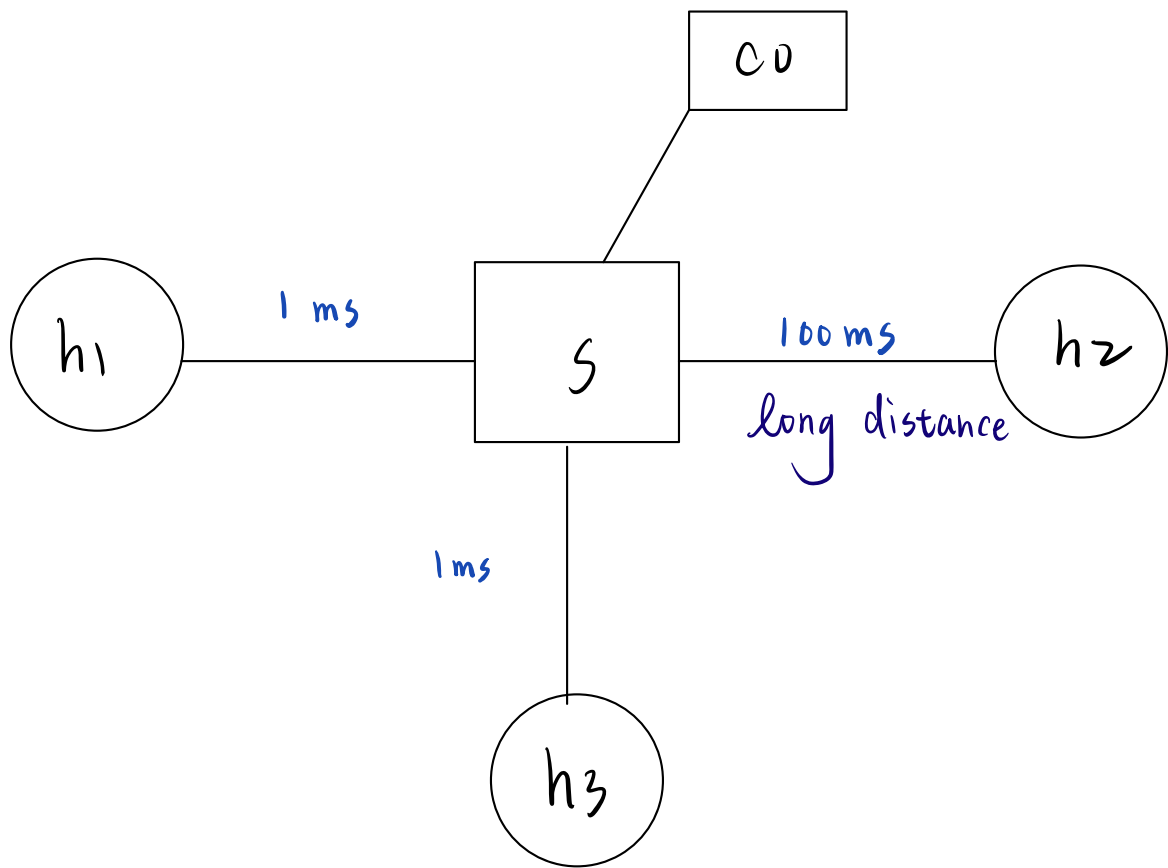

```
> sh ovs-ofctl add-flows s1 ip,nw_src=10.0.0.3,nw_dst=
10.0.0.1,actions=mod_nw_src=10.0.0.2,output:1
```

```
> xterm h1 h2 h3
```

```
h2
# tcpdump -i h2-eth0
```

```
h3
# tcpdump -i h3-eth0
10.0.0.1 > 10.0.0.3
10.0.0.3 > 10.0.0.1
```

```
h1
# ping h2
```

$$h1 - h2 > 202ms$$

$$h1 - h3 > 4ms$$

# python 4.py

> h1 ping h2 -c 5

206 ms  
203  
205  
:

> h1 ping h3 -c 5

6.70 ms  
8.11  
7.08

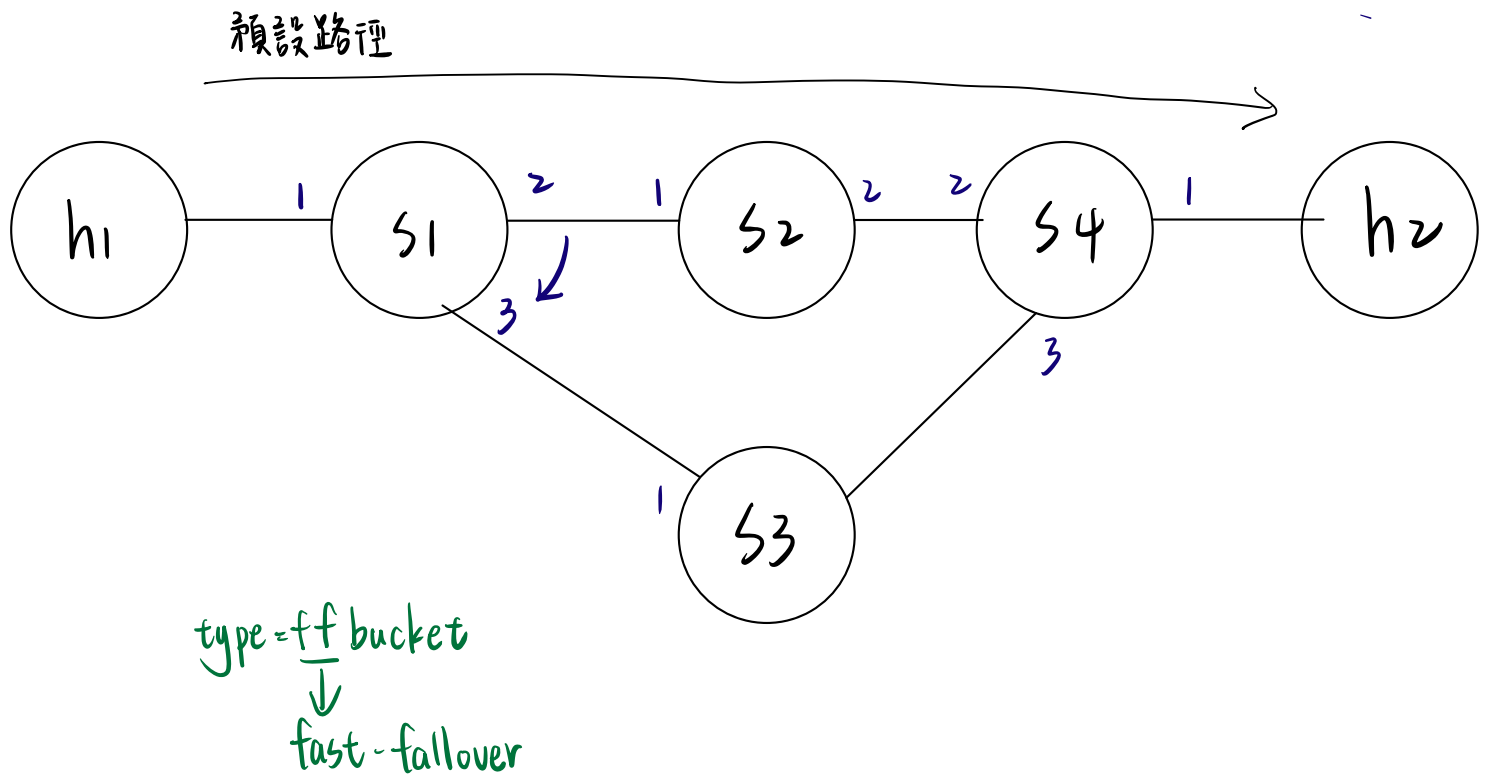

link s1 s2 down

openflow 1.3 新功能

1. fastfailover

快速的錯誤切换

當發生錯誤，2 port 切換到 3 port

```
# python test-fast-fallover.py
```

new terminal

```
# chmod +x rule1.sh  
# ./rule1.sh
```

```
> sh ovs-ofctl -O OpenFlow3 dump-flows s1
```

```
> xterm h1
```

```
> sh ovs-ofctl dump-port s1
```

h1  
# ping 10.0.0.2

```
> link s1 s2 down 關閉 2port 路綫
```

```
> sh ovs-ofctl dump-port s1
```

```
> link s1 s2 up 開啟 2port 路綫
```

2. group-select : load balancer

隨機挑選 bucket, 這樣路徑都會被用到
